

Lubrication skills acquired

Condat Corp of France has acquired the lubricant activities of Renite Co in the USA. Expertise in the glass and metal forging industries, together with long established skills in lubrication, are common assets of both companies, so this agreement extends Condat's range of lubricants and strengthens its diversification strategy in North America.

Established in 1932, Renite has long been regarded for its specialist lubricants and custom solutions, offering high temperature industrial lubricants. Its products include swabbing lubricants such as those for mould release in container manufacturing applications, as well as sprayable products for tableware. Furthermore, Renite produces various lubricants for all stages in which the glass requires lubrication, from shears to lehrs.

With extensive experience and more than 30 years of partnership with important glass groups, Condat offers a complete range of lubricants and coatings to meet the requirements of the evolving glass process. For hollow glass, soluble oils are available for shear spray, neat oils for scoop and delivery, deflectors, mould release lubricants and synthetic oils for the central lubrication of IS machines. For flat glass, lubricants are offered for cutting, grinding, glass protection, marking inks and flocculants etc, while for optical and ophthalmic glass, coolants are produced for processing, surfacing and flocculants. ■
